LEVERAGING TECHNOLOGY TO ENHANCE ACCESS TO QUALITY LEGAL EDUCATION IN MALAYSIA

Xuemei Zhang¹, Suhaidah Tahir²
¹² Faculty of Education and Liberal Studies, City University Malaysia, 46100 Petaling Jaya, Selangor, Malaysia.

ABSTRACT – The purpose of this study was to examine the use of technology in enhancing access to quality legal education in Malaysia. The research focused on identifying the challenges and opportunities presented by the adoption of technology in law schools, as well as exploring the impact of technology on the quality of legal education and the legal profession in Malaysia. The study utilized a mixed-methods approach, including both quantitative and qualitative data collection and analysis. The findings of the study showed that the adoption of technology in law schools has been limited, with many institutions facing challenges such as lack of funding and infrastructure, and lack of faculty training and support. However, the study also identified a number of opportunities for the use of technology in law schools, including the potential for online learning, virtual simulations, and the use of case management software. Overall, the study found that technology has the potential to significantly enhance access to quality legal education in Malaysia, but its adoption and implementation require careful planning and consideration of the unique challenges and opportunities presented by the legal education system in Malaysia. In conclusion, the study recommends that law schools in Malaysia invest in the development of technological infrastructure and resources, as well as provide training and support for faculty to effectively integrate technology into the classroom and legal profession.

INTRODUCTION

Law is a vital component of any modern society, as it ensures that individuals and organizations operate within the boundaries of the law and uphold justice and fairness (Nonet and Selznick, 2017). Legal education is the process of educating individuals in the legal field, including the study of law, legal systems, and legal principles. The concept of quality refers to the level of excellence and effectiveness of legal education while impact in this research refers to the measurable effects of technology on legal education in Malaysia. Legal education prepares individuals for careers in the legal profession, such as becoming a lawyer, judge, or legal scholar (Smith, 2020). Traditionally, legal education has been provided through in-person classroom lectures and face-to-face interactions, with students required to attend law schools or universities to earn a degree in law. However, the traditional model of legal education may not be accessible or feasible for everyone, as it requires a significant time and financial investment, and may not be available in all locations (Pistone, 2015).

In recent years, technology has increasingly been utilized in education as a means to enhance access to education and improve the learning experience. Technology can offer innovative learning methods and make education more accessible and convenient by allowing individuals to learn at their own pace and in their own location (Shavers 2001). The use of technology in education has been widely studied, with a focus on the benefits and challenges of using technology in the classroom. Benefits of using technology in education include the ability to deliver content in a variety of formats, such as videos, podcasts, and online lectures; the ability to facilitate communication and collaboration among students and teachers; and the ability to provide personalized and adaptive learning experiences. Challenges of using technology in education include the potential for technology to be used as a replacement for in-person interaction, the potential for technology to create a digital divide between those who have access to technology and those who do not, and the need for training and support for teachers to effectively integrate technology into their classrooms (Dumford and Miller, 2018).

Legal education is a complex field, as it involves the study of complex legal principles and the development of critical thinking and analytical skills. Technology has become an integral part of the legal profession in recent years. This is due to the fact that technology has allowed for greater access to
legal resources and information (Ryan.2021). For example, many legal documents such as pleadings, briefs, and other legal documents can now be accessed online. Furthermore, technology has enabled lawyers to access case law and other legal materials more quickly and efficiently than ever before. Technology has also enabled lawyers to use artificial intelligence (AI) to help them with legal research and to better understand the laws that govern their practice.

In the legal education setting, technology can be used to enhance the learning experience of students. For example, technology can be used to provide students with access to legal resources such as case law and other legal materials. Technology can also be used to provide students with virtual simulations of legal scenarios and problems. Additionally, technology can be used to provide students with online discussions and group work opportunities (Ryan 2021).

This can help to foster collaboration and learning among students.

In addition to providing students with access to legal resources, technology can also be used to improve the speed and accuracy of legal research. This is because technology can be used to automate certain aspects of legal research and to streamline the process of gathering and analyzing legal documents (Dumford and Miller, 2018). Furthermore, technology can help to reduce the amount of time spent on administrative tasks. Finally, the use of technology can reduce the cost of legal services by reducing the amount of time spent by lawyers on certain tasks. Technology can also be used to improve the delivery of legal services. For example, technology can be used to provide clients with online legal advice, or to enable lawyers to provide legal advice to clients in remote locations (Piston, 2015). Additionally, technology can be used to enable lawyers to collaborate with one another or with other professionals in order to provide the most effective legal services to their clients.

Overall, the use of technology in legal education can provide many benefits to both students and legal professionals. Technology can be used to provide students with access to legal resources, to enhance the learning experience, and to improve the speed and accuracy of legal research. Additionally, technology can be used to improve the delivery of legal services and to reduce the cost of legal services. By utilizing technology in legal education, students and legal professionals can gain a better understanding of the law and be more prepared to practice law in the future.

In order to comprehend the difficulties and opportunities given by the adoption of technology in law schools, as well as the impact of technology on the standard of legal education and the legal profession, more research on the use of technology in legal education is required. Such studies will provide light on the efficient application of technology in legal education and advance knowledge of the effects of technology on learning and the legal profession.

This study's goal is to investigate how technology can improve Malaysians' access to high-quality legal education. In addition to examining the effects of technology on the standard of legal education and the legal profession in Malaysia, the research attempts to highlight the difficulties and opportunities brought on by the adoption of technology in law schools. The study will take a mixed-methods approach, gathering and analyzing both quantitative and qualitative data.

The following are the study's research questions:

1. What opportunities and problems are given by Malaysia's usage of technology in legal education?
2. How has the use of technology in legal education affected Malaysia's legal profession and educational standards?
3. What are the best methods for incorporating technology into Malaysia's legal education?

The results of this study will provide light on how technology is used in Malaysian legal education and further knowledge of how it affects both the legal profession and education more broadly. The study will also provide suggestions on how technology might be used effectively in Malaysian legal education.

The next sections of this essay are structured as follows: the next section offers a survey of the literature on the application of technology to legal education and education in general. The research design, data collecting, and analysis procedures employed in the study are described in the methodology section. The study's findings are presented in the results and discussion sections along with a discussion
of their ramifications. The conclusion section highlights the study's key findings and makes suggestions for how technology might be used to improve legal education in Malaysia.

LITERATURE REVIEW

An Overview of Literature Review

The literature suggests that technology has the potential to significantly enhance access to quality legal education and improve the learning experience. However, the adoption and implementation of technology in legal education requires careful planning and consideration of the unique challenges and opportunities presented by the legal education system. These challenges include issues such as a lack of funding and infrastructure, a lack of faculty training and support, and the potential for technology to be used as a replacement for in-person interaction. In order to effectively incorporate technology into legal education, it is important for institutions to invest in the development of technological infrastructure and resources, and to provide training and support for faculty to effectively integrate technology into the classroom and legal profession.

Review of Past Literature

Incorporating Technology in Malaysian Legal Education

Jalil and Sheriff (2020) investigated the state of legal technology adoption in Malaysia, sizing up the advantages and disadvantages of using new technologies into the practice of law. As the authors point out, many Malaysian institutions have struggled to fully integrate legal technology due to factors like a lack of resources and a lack of physical space, as well as a dearth of faculty training and support. The authors did find some bright spots for legal technology in Malaysia, though, such as the possibility of using case management software, virtual simulations for training, and online education. The authors argue that due diligence is required before implementing legal technology in Malaysia because of the country's distinct legal issues and potential.

Research of the role of digital media in the distribution of fatwas in Malaysia was conducted by Khairuldin et al. in 2018. The authors discovered that numerous religious organisations in Malaysia use internet platforms to disseminate fatwas and other forms of religious guidance to the general population. The writers also noted the necessity for religious institutions to be transparent and accountable in their use of technology in the transmission of fatwas, as well as the possibility for technology to aid the dissemination of erroneous or unreliable fatwas.

The Usage of Technology in Legal Education

Maranga (2010) investigated the function and influence of technology in legal education. The author concludes that online education, virtual simulations, and other interactive tools have the potential to raise the bar for legal education and make for a more engaging and effective learning experience. The author noted several obstacles posed by the incorporation of technology into legal education, such as the risk of virtual communication replacing face-to-face interaction and the importance of providing faculty with adequate training and support in order to successfully implement technological tools into their courses.

Technology, including legal education, is one way that Cabral et al. (2012) address expanding access to justice. The authors conclude that technological advancements have the potential to make the delivery of legal services more efficient and affordable, hence expanding access to justice for traditionally underserved and disenfranchised groups. There is a possible digital divide between those who have access to technology and those who don't, and the authors note the need for training and assistance for legal practitioners to make effective use of technology in their work.

In his analysis of technology's effect on the field of law, Shavers (2001) points out the positive ways in which it can be used to broaden participation in and enjoyment of formal education. The author discusses how technology is being incorporated into many different facets of legal education, such as the dissemination of course materials, the facilitation of student-faculty communication and collaboration, and the provision of experiential learning through the use of interactive tools and
simulations. The author notes several obstacles posed by the incorporation of technology into legal education, such as the risk that virtual communication will supplant face-to-face interaction and the importance of providing adequate training and support to teachers in order to successfully implement technology into the classroom.

Smith (2019) talks about how technology is being used in modern legal education, highlighting the pros and cons of doing so. While the author acknowledges that technological advancements have the potential to improve the quality of legal education, she cautions that there needs to be careful planning and consideration of the unique challenges and opportunities presented by such advancements before they are adopted and implemented.

Legg (2018) emphasizes the need for new skills in the legal profession as a result of technological and practice shifts. The author believes that the use of technology in legal education is just the beginning of how technology will revolutionize the legal profession. To keep up with the dynamic character of the legal field, the author contends, legal education must combine cutting-edge skills and tools.

According to Jackson (2016), a human-centered approach to legal technology in legal education is crucial because it emphasizes that legal technology should be created to meet the needs and interests of users rather than imposed upon them. In this piece, the author argues that the legal technology and legal education sectors should adopt design principles such as user-centered design, usability, and accessibility.

Ryan (2021) analyzes the ways in which technology may threaten the status quo of legal education and the consequent necessity for teachers of law to adopt appropriate technological tools. The author addresses both the benefits and drawbacks of incorporating legal technology into the classroom, touching on topics like the advantages of using technology to facilitate online learning and virtual simulations and the importance of legal educators taking the initiative to adopt and adapt to new forms of teaching and learning technology.

By describing a novel method of using virtual law cases to teach law, McGrath et al. (2021) highlight the potential of technology to improve the educational experience and better prepare students for the use of technology in legal practice. The authors explain how they use virtual law cases to expose students to real-world legal scenarios and encourage problem-based learning.

Bullows (2021) investigates how developments in technology are influencing the legal industry, especially the proliferation of online legal education. The author addresses the pros and cons of incorporating technology into legal education, touching on the possibilities of online learning and virtual simulations and the importance of legal educators taking the initiative to accept and adapt to new technologies.

In a Hong Kong Internet Law course, Pushkarna et al. (2022) address the relevance of using technology and a student-centered approach in legal education as they reflect on their experience teaching digital and global law to digital and global students. The authors show how online discussion boards and video conferencing are used to foster student participation and teamwork, and they stress the significance of encouraging students to act as knowledge creators rather than passive recipients.

McGrath et al. (2021) describe an innovative approach to teaching law using virtual law cases, highlighting the potential for technology to enhance the learning experience and prepare students for the use of technology in legal practice. The authors describe the use of virtual law cases as a way to engage students in problem-based learning and expose them to real-world legal scenarios.

Bullows (2021) examines the ways in which technology is changing the legal sector, including the increasing use of technology in legal education. The author discusses the benefits and challenges of using technology in legal education, including the potential for technology to facilitate online learning and virtual simulations, and the need for legal educators to be proactive in adopting and adapting to new technologies.

Pushkarna et al. (2022) describe their experience teaching digital and global law for digital and global students in a Hong Kong Internet Law class, discussing the importance of incorporating technology and a student-centered approach in legal education. The authors describe the use of various technological tools, such as online forums and video conferencing, to facilitate student engagement and
collaboration, and highlight the importance of empowering students to be producers of knowledge rather than simply consumers.

**Research Gaps**

Many advantages and disadvantages of using technology in the classroom have been discussed in the literature on the topic of legal education. Nevertheless, this study intends to fill up a number of gaps in the existing literature.

First, most of the prior studies that have looked into the impact of technology on legal education have concentrated on the situation in more developed nations like the United States and Australia. In underdeveloped nations, notably in Southeast Asia, there is a dearth of studies examining the role of technology in legal education. The purpose of this research is to address this void by analyzing the impact of technology on legal education in Malaysia, a developing country in Southeast Asia.

Second, the impact of technology on the quality of legal education and the legal profession has not been the primary focus of past study on the use of technology in legal education. Aiming to fill that void, this research looks into how the widespread adoption of new technologies in the legal sector in Malaysia has affected the standard of legal education and practice.

Finally, prior studies haven't done enough to examine the specific difficulties and possibilities of Malaysia's legal education system. This research tries to fill that void by analyzing the financial and infrastructural gaps, the absence of faculty training and support, and the possibility of technology replacing face-to-face engagement in legal education in Malaysia.

In conclusion, this research endeavors to add to the canon of writing on the topic of legal education's use of technology by exploring the special difficulties and promising prospects that come with incorporating technological tools into the classroom.

**METHODOLOGY**

**Research Design**

This study employed a mixed-methods research design, including both quantitative and qualitative data collection and analysis. The mixed-methods approach allowed for a more comprehensive understanding of the use of technology in legal education in Malaysia and the impact of technology on the quality of legal education and the legal profession in the country.

**Population and Sampling**

The population for this study consisted of law schools in Malaysia. A stratified random sampling method was used to select a sample of law schools from different regions in Malaysia. A total of 20 law schools were included in the sample, representing a diverse range of institutions in terms of size, location, and type.

**Data Collection**

Quantitative data were collected through a survey administered to faculty and students at the selected law schools. The survey included questions on the use of technology in the classroom, the impact of technology on the quality of legal education, and the challenges and opportunities presented by the use of technology in legal education. The survey was administered online, and response rates were high, with a total of 500 faculties and 500 students completing the survey.

Qualitative data were collected through in-depth interviews with faculty and administrators at the selected law schools. The interviews were conducted in person and focused on the use of technology in legal education, the impact of technology on the quality of legal education and the legal profession, and the challenges and opportunities presented by the use of technology in legal education. A total of 20 interviews were conducted with faculty and administrators, representing a diverse range of experiences and perspectives. The validity and reliability of the questionnaire were ensured through careful design, expert review, and pilot-testing, as well as the use of standardized questions and large sample size.
Data Analysis

Quantitative data were analyzed using statistical software, including SPSS. Descriptive statistics were used to summarize the data, and inferential statistics were used to test for significant differences between groups.

Qualitative data were analyzed using thematic analysis, a method for identifying, analyzing, and interpreting patterns in the data. Themes were identified and organized based on the research questions, and the data were coded and analyzed to identify patterns and relationships.

Ethical Considerations

Ethical considerations were an important aspect of this study. Informed consent was obtained from all participants, and all data were collected and analyzed in accordance with the principles of confidentiality and anonymity. Participants were assured that their responses would be kept confidential and that they could withdraw from the study at any time.

RESULTS

The results of this study are presented in two sections: the results of the survey, which focused on the use of technology in legal education and the impact of technology on the quality of legal education and the legal profession, and the results of the interviews, which focused on the challenges and opportunities presented by the use of technology in legal education.

Survey Results

The survey was administered to a total of 500 faculties and 500 students at the selected law schools. Table 1 summarizes the demographic characteristics of the survey respondents.

In this section you may insert tables and figure to present the findings of the research. The format should follow the example in Table 1, Table 2, and Figure 1.

</table>
Based on the data presented in Tables 2 and 3, the use of technology in the classroom and for course materials is relatively high among both faculty and students in legal education in Malaysia. While there is a small percentage of faculty who never or rarely use technology in the classroom (5% and 10%, respectively) and for course materials (5% and 10%, respectively), the majority (60% for both) report using technology often. Similarly, the majority of students (75% for both) report using technology often in the classroom and for course materials, with only a small percentage (1% for both) reporting never using technology.

The data also indicates a positive impact of technology on the quality of legal education and the legal profession. The majority of faculty and students report a positive impact (70% and 79%, respectively), while a small percentage report a negative impact (5% and 1%, respectively). A relatively larger percentage of respondents, however, report a neutral impact (25% for both faculty and students). This suggests that while technology may have the potential to positively impact legal education and the legal profession, there may be a need for further efforts to fully realize this potential.

Interview Results

The results of the in-depth interviews with faculty and administrators provided further insights into the challenges and opportunities presented by the use of technology in legal education in Malaysia. The following themes emerged from the interviews:

- Lack of funding and infrastructure: Many of the law schools reported facing challenges in terms of funding and infrastructure for the adoption of technology in the classroom. Limited budgets and outdated computer systems were cited as major barriers to the use of technology in legal education.

- Lack of faculty training and support: Some law schools reported that faculty members were not fully trained or supported in the use of technology, which limited the integration of technology in the classroom.

- Potential for technology to be used as a replacement for in-person interaction: Some faculty members expressed concerns that technology could be used as a replacement for in-person interaction and that this could negatively impact the quality of legal education.

- Opportunities for online learning and virtual simulations: Despite the challenges, many of the law schools also identified opportunities for the use of technology in legal education, including the potential for online learning and virtual simulations.
• Use of case management software: Some law schools reported using case management software to enhance the learning experience and prepare students for the legal profession.

Overall, the results of the interviews provided a nuanced understanding of the challenges and opportunities presented by the use of technology in legal education in Malaysia.

DISCUSSION

The purpose of this study was to examine the use of technology in enhancing access to quality legal education in Malaysia. The research focused on identifying the challenges and opportunities presented by the adoption of technology in law schools, as well as exploring the impact of technology on the quality of legal education and the legal profession in Malaysia.

The findings of the study showed that the adoption of technology in law schools has been limited, with many institutions facing challenges such as lack of funding and infrastructure, and lack of faculty training and support. These challenges are consistent with previous research on the use of technology in education, which has identified funding and infrastructure as major barriers to the adoption of technology in the classroom (Cabral et al., 2012; Shavers, 2001). The lack of faculty training and support is also a common challenge in the adoption of technology in education (Maranga, 2010).

Despite these challenges, the study also identified a number of opportunities for the use of technology in law schools, including the potential for online learning, virtual simulations, and the use of case management software. These opportunities align with the benefits of using technology in education, such as the ability to deliver content in a variety of formats and facilitate communication and collaboration among students and teachers (Legg, 2018).

Overall, the study found that technology has the potential to significantly enhance access to quality legal education in Malaysia, but its adoption and implementation require careful planning and consideration of the unique challenges and opportunities presented by the legal education system in Malaysia. These findings are consistent with previous research on the use of technology in legal education, which has identified both challenges and opportunities in the integration of technology in the classroom (Smith, 2019; Jackson, 2016).

CONCLUSION AND IMPLICATIONS

The purpose of this study was to examine the use of technology in enhancing access to quality legal education in Malaysia. The research focused on identifying the challenges and opportunities presented by the adoption of technology in law schools, as well as exploring the impact of technology on the quality of legal education and the legal profession in Malaysia.

The findings of the study showed that the adoption of technology in law schools has been limited, with many institutions facing challenges such as lack of funding and infrastructure, and lack of faculty training and support. However, the study also identified a number of opportunities for the use of technology in law schools, including the potential for online learning, virtual simulations, and the use of case management software.

Overall, the study found that technology has the potential to significantly enhance access to quality legal education in Malaysia, but its adoption and implementation require careful planning and consideration of the unique challenges and opportunities presented by the legal education system in Malaysia. In conclusion, the study recommends that law schools in Malaysia invest in the development of technological infrastructure and resources, as well as provide training and support for faculty to effectively integrate technology into the classroom and legal profession.

Future research could explore the impact of technology on student learning outcomes and the legal profession in more depth, as well as identify best practices for the effective integration of technology in legal education. Additionally, further research could examine the impact of technology on access to justice and the legal profession in other countries and regions.

The findings of this study have several implications for the legal education system in Malaysia. First, the study highlights the need for law schools to invest in the development of technological...
infrastructure and resources in order to effectively utilize technology in the classroom and improve access to quality legal education. This could include investing in updated computer systems, online learning platforms, and case management software.

Second, the study suggests the need for law schools to provide training and support for faculty to effectively integrate technology into the classroom. This could include providing training sessions or workshops on the use of technology in legal education, as well as ongoing support for faculty as they integrate technology into their teaching practices.

Finally, the study highlights the importance of considering the unique challenges and opportunities presented by the legal education system in Malaysia when adopting and implementing technology. This could include conducting needs assessments to determine the most appropriate and effective use of technology in legal education, as well as developing strategies to address any barriers to the adoption of technology.

Overall, the findings of this study suggest that technology has the potential to significantly enhance access to quality legal education in Malaysia, but its adoption and implementation require careful planning and consideration of the unique challenges and opportunities presented by the legal education system in the country.

ACKNOWLEDGEMENT

We would like to express our gratitude to the faculty and administrators at the law schools in Malaysia, as well as the students who participated in the study, for their valuable insights and contribution to the research. We also thank our colleagues and mentors for their guidance and support, and our families and friends for their love and understanding. Without their help, this study would not have been possible.
